

Introduction to Cognition
& Cognitive Psychology

1

1

What is cognition?

2

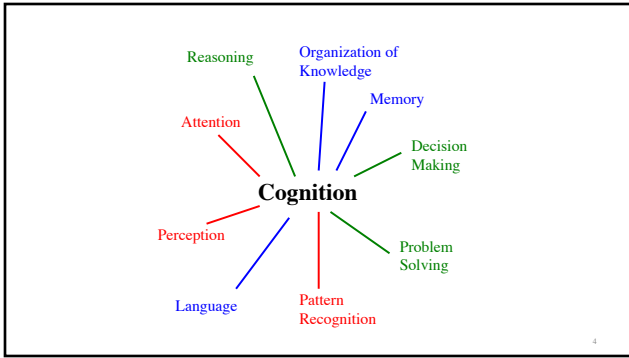

2

Cognition

The basic mental processes that are part of mind, for example: perception, attention, pattern recognition, memory, language, reasoning, etc.

3

3

4

Question

- Answer this question as quickly as you can:
- How many hands did Aristotle have?
- What mental processes were involved in answering that question?

5

So...

How many hands did Aristotle have?

What did you write down?

What aspects of cognition were involved in that task?

6

What is Cognitive Psychology?

7

7

Our Definition of Cognitive Psychology

A specific theoretical approach to the study of mind (cognition) in which cognitive structures & processes are inferred from performance (behavior) on specific, carefully designed cognitive tasks.

8

8

Digit Span Demo

9

6 9 1 4 3 8 2 5	(08)
4 7 5 3 9 8 1 7 4	(09)
3 1 9 6 8 2 3 5 4 6	(10)
5 4 7 5 6 3 9 8 1 4 3	(11)
2 9 6 4 2 5 8 4 3 9 1 5	(12)
6 9 8 2 5 3 4 7 4 9 5 4 3	(13)

10

10

What can we infer from your performance?

- Short-Term vs. Long-term Memory
- **Capacity** of STM
- **Duration** of the memory
- Type of **Code**

11

11

Key Ideas

- Cognition (cognitive structures & processes) inferred from behavior (performance).
- Cognitive process occur over time in a sequence (early versus late processing)
- Cognitive processes occur at different levels (lower versus higher level processing)

12

12

Levels (low versus high) of Cognitive Structures/Processes

13

Another Key Idea

Cognition or Memory and Thinking are conceptualized in Information Processing terms – a sequence of processing steps and a series of transformations as the information is transferred from one stage to the next.

14

Another Key Idea

- Cognitive structures and processes (e.g. memory) can be decomposed (i.e. broken down) into simpler structures and processes (e.g. short-term memory vs. long-term memory)

15

Representations or Codes

- System of signals used to represent something -- e.g. code for the alphabet
- Cognitive Codes: e.g. the word 'hand' --> phonemic code (language sounds) vs semantic codes (conceptual meaning)
- Neural Codes: e.g. the word 'hand' encoded as a pattern of light on the retina; meaning is encoded as a pattern or neural activity

16

16

Level of Description

- Mental Level (your awareness)
- **Cognitive Level** (inferred from behavior – i.e. abstract description)
- Neural Level

17

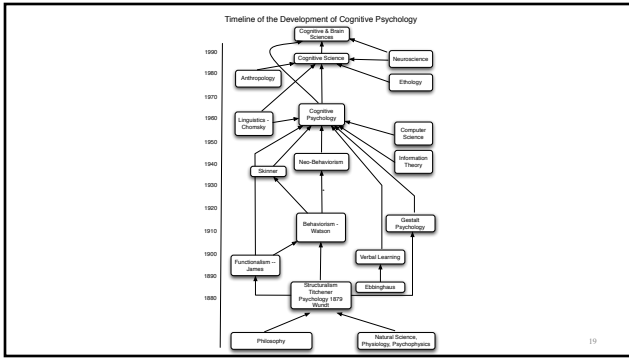

17

Approaches to the Study of Mind (Cognition)

- Philosophy
- Introspection
- Behaviorism
- Cognitive Psychology
- Cognitive Neuroscience

18

18

19

Philosophy

20

The Philosophical Approach

- Interest in the human memory and thought goes back to the Greeks and earlier
- Plato, Aristotle, Descartes, Kant
- Aristotle
 - systematic observation of his own thinking
 - Induce general laws of thought from self-observation
 - Thinking corresponds to a sequence of associations

21

Thinking as a Sequence of States

Figure 1. Thinking as a sequence of states. A graphical illustration of Aristotle's reported sequence of thoughts "from milk to white, from white to air, and from this to fluid, from which one remembers autumn, the season one is seeking" [Aristotle translated by Sorabji (1972, p. 56)].

22

22

Ideas from Philosophical Approach

- Many cognitive issues and ideas began with philosophical investigation
- Plato's notion of ideal forms – innate ideas or knowledge (the *nativist* idea)
- Aristotle's notion that all knowledge derives from experience ("tabula rasa").

23

23

Introspection

24

24

Wilhelm Wundt

- “ Conscious processes and immediate experience”
- Introspection or “self observation”
- Rigorous Methods

Edward B. Titchener - Wikipedia

Edward Bradford Titchener (11 January 1867 – 3 August 1927) was an English psychologist who studied under Wilhelm Wundt for several years. Titchener is best known for creating his version of psychology that described the structure of the mind, **structuralism**.

Doctoral students: Edwin Garriques Boring — Doctoral advisor: Wilhelm Wundt
Fields: Psychology — Known for: Structuralism; empathy; introsp.

Biography · Personal life · Main ideas · Life and legacy

People also ask

What was Edward Titchener theory?

It was here that he established the psychological school of thought known as **structuralism**. Titchener believed that by systematically defining and categorizing the elements of the mind, researchers could understand the structure of the mental processes.

Edward B. Titchener

Psychologist

Edward Bradford Titchener was an English psychologist who studied under Wilhelm Wundt for several years. Titchener is best known for creating his version of psychology that described the structure of the mind, structuralism.

Born: January 11, 1867, Chichester, United Kingdom
Died: August 3, 1927, Ithaca, NY
Known for: Structuralism, Empathy, Introspection
Nationality: American, English
Education: Grosvenor College, Clark University, University of Oxford, Malvern College, Lehigh University

31

Behaviorism

32

32

Behaviorism – Principles 1

- John B. Watson (1924)
- Reaction to Introspection
- Emphasis on observable, quantifiable behavior
- No unobservables, no internal mental states, no images, ideas, or thoughts

33

33

Behaviorism – Principles 2

- Psychology = Scientific study of behavior
- Humans as passive reactors to external stimuli
- “Tabular Rasa” - Environmental determinants of behavior
- Rats in mazes, puzzle boxes, etc.

34

34

Behaviorism - Positive Contributions

- Insistence on precise & careful definition of concepts
- Operational Definition
 - e.g. learning= # trials necessary to complete a maze with no errors
- Experimental Controls

35

35

Back in Europe ...

36

36

Herman Ebbinghaus

- Study higher mental processes using scientific method
- Process of association formation
- Non-sense syllables
- Savings Method

38

38

Ebbinghaus' Method

1. Learn list to 2 perfect recitations (# trials)
2. Set aside (varied delay)
3. Relearn (# trials)
4. Measurement of Savings

$$\frac{\# \text{ Trials to Learn} - \# \text{ Trials to Relearn}}{\# \text{ Trials to Learn}}$$

39

39

Measurement of Savings

$$\frac{\# \text{ Trials to Learn} - \# \text{ Trials to Relearn}}{\# \text{ Trials to Learn}}$$

40

Forgetting Curve

41

Gestalt Psychology

- Laws of organization
- Law of proximity
- Law of similarity
- Insight problem solving

42

Law of Similarity

```
0 0 0 0
X X X X
0 0 0 0
X X X X
```

43

43

Law of Proximity

```
0 0 0 0
X X X X
0 0 0 0
X X X X
```

44

44

The Cognitive Revolution

- Return to mentalistic ideas (1940' s and 50' s)
- MIT – Sept. 11, 1956
- Neisser' s book Cognitive Psychology (1967)
- Information processing perspective
- Diverse Influences/ Causes

45

45

46

Dissatisfaction with Behaviorism

- Challenges to “tabular rasa”
- Innate structure or knowledge
- Complex human behavior not explainable in terms of stimulus-response relations alone

47

Verbal Learning

- Flourishing of Ebbinghaus tradition
- Different types of memory, memory organization, models
- Active nature of learner--what is brought to learning
- Formation of new associations --> Use of pre-existing associations.
- Emphasis on Memory over learning

48

Bousfield (1953)

Words presented in this order:	apple bicycle shirt chair banana car socks desk peach truck dress couch orange train hat rug	desk couch chair peach apple hat shirt dress ... Etc.	But recalled In this order
--------------------------------------	---	--	-------------------------------

49

49

Verbal Learning ...

- Existing memory associations lead to reorganization of words during recall
- Mental Processes: rehearsal, storage, organization, retrieval
- Acceptance of objective methods & procedures
- But increased commitment to inferred processes -- e.g. encoding, storage, retrieval

50

50

New Disciplines Emphasizing Information Processing

- Communications Theory
- Information Processing
- Computer Science

51

51

Communications Theory

- Information processing idea
- Similarity between communication devices and people
- 1st approximation analogy for psychology to describe mental processes
- Channel, information processing filters, limited capacity, serial vs. parallel processing.

52

52

Information Theory

53

53

Information Processing of Sensation & Perception

FIGURE 3.1 Information Processing Model of Sensation and Perception The model illustrates both observable external phenomena and unobservable internal stages and processes.

54

54

Computers & Computer Science

- Numerous contributions
- Analogy of computers & humans
- Both process information: Take in information, transform, manipulate, store, & output information (or some type of product--e.g. behavior)
- Humans & computers as symbol manipulators

55

55

Atkinson & Shiffrin Memory Model

56

56

Many Contributions

- Borrowing of concepts & characteristics of computers to describe human system: sensory store, short-term store, long-term store
- Limited capacity--immediate memory & attention

57

57

Additional Contributions

- Computer programs/processes analogous to mental processes
 - Simulation modeling
 - AI
- Computer as tool
 - Stimulus Presentation

58

58

Current Issues Related to Cognitive Psychology

- Ecological Validity
- Cognitive Science
- Cognitive Neuroscience
- Artificial Intelligence
- Parallel Distributed Processing Approach

59

59

Cognitive Neuroscience

- Investigates the relationships between brain structures & function and cognitive structures & processes.
- Importance of Cognitive Task Analysis
- Many New Tools/Techniques

60

60

Cognitive Neuroscience Techniques

- Brain Lesions
- Brain Imaging Techniques
 - PET (Positron Emission Tomography)
 - MRI (Magnetic Resonance Imaging)
 - fMRI (functional Magnetic Resonance Imaging)
- Event-Related Potential - ERP
- Single-cell Recording Technique

61

61

PET Scanner vs. MRI Scanner

62

62

fMRI Scan

63

63

PET Scan

PET Scan while listening to a language task (unpracticed)

versus

PET Scan after practice with on the same language task (practiced)

64

64

Event-Related Potentials

65

65

Artificial Intelligence

- Machine Metaphor
- Artificial Intelligence (Pure AI) vs.
- Computer Simulation (Weak AI)

66

66

PDP - Parallel Distributed Processing

- Cognitive processes can be understood in terms of networks of 'neuron-like' units
- Connectionism vs. neural networks
- Parallel vs. Serial Distinction

67

67

Themes

- Cognitive processes are active
- Cognitive processes remarkably efficient & accurate
- Cognitive processes handle positive information better than negative
- Cognitive processes are Interrelated
- Many cognitive processes rely on both bottom-up and top-down processing

68

68

What do you see?

69

69

What letter is this?

A

THE MAN RAN.
